Job Application for Software Engineer

Dear Sir/Madam,

About Me

One of my major passions in life is technology. I developed my passion more deeply through undergraduate, master's studies in Software Engineering. During this period I also applied my knowledge and enthusiasm to real-world applications by working in industry as a software engineer. I have a dream that I can do something that has a direct impact on people's lives and makes the world better.

Why Google?

I believe that as a Google Software Engineer I would have the opportunity to participate in cutting-edge projects that aim at improving people's lives. In addition, working in a company as far-reaching and diverse as Google would allow me to continue doing what I most like in my job in academia, namely facing new challenges on a regular basis and working out innovative solutions.

Finally, I am just a big fan of Google. I like its products (specially Google Search , Google Maps, and Google Books), I like its history (its being born almost by chance), and I share its core principles (in particular *Great just isn't good enough*).

Why Me?

I have the following qualifications and skills relevant for a Software Engineer position:

- BS, MS in Software Engineering.
- Solid foundation in computer science, with strong competencies in algorithms and programming languages.
- Excellent analytical, troubleshooting, and communication skills.
- Experience programming in Java.

Altogether, I am convinced that my strong background in software engineering, together with my creativity, enthusiasm, and commitment would be of great value to Google.

Sincerely,

Cheng Pan
